

## Car Dealership ERD explanation

-For the following tables :customerSean, SalsespersionSean, carSean, partsSean, mechanic\_sean, and service\_ticket\_Seau, I decided to create these tables first as they have no foreign key(FK) in them.

- After I created the following tables I created the service\_ticket\_sean table because it had the two foreign keys that I have already created, car\_id and customer\_id
- I then created the parts\_used\_sean table and used the foreign keys of service ticket id and part\_id
- From there I created mechanicService\_sean table and used the newest foreign key service\_ticket\_sean, along with mech\_id, and service\_id
- The last table I created was InvoiceSean because it holds the most foreign keys than any other table.
